Academic Year 2025-26
College Of Business Administration
Imam Abdulrahman Bin Faisal University

Introduction:

Najd Tech Store is a full-fledged online software which is developed with the ecommerce business model for the purpose of purchasing and selling technological devices. The platform aims to give consumers a convenient and hassle-free e-commerce experience, allowing them to view various electronic products, compare specifications and prices, and make smooth purchases. Meanwhile, for sellers, the system provides a simplified way to list, manage and market their devices, thereby establishing a dynamic digital marketplace where both buyers and sellers can engage. This project's main goal is to combine business value and provide a user-friendly and intuitive web experience. Convenience, product range and accurate information before buying purchases are becoming increasingly important needs for consumers, as online shopping becomes more important, especially in the technology sector. To address these needs, Najd Tech Store provides a platform that makes technology more accessible, better decision making and informed consumer behavior possible.

The project aims to mimic real-world e-commerce needs and provide a practical digital commerce solution, from a business standpoint. The development team will create and build the application using real business processes, ensuring that the platform is in line with industry standards. In conclusion, the project aims to establish a strong, flexible, and economically sustainable platform that meets the modern needs of digital commerce and is designed to meet the changing demands of the technology consumer and market.

Business Problem:

With the fast-paced evolution of technology, consumers are increasingly demanding to buy electronic products through e-commerce platforms such as smartphones, laptops, tablets, headphones, smart watches, gaming accessories and all other electronic gadgets. Even though this is increasing, users encounter several problems when making online purchases for technology products. Lots of websites do not give thorough and reliable information about their products and some do not have user friendly and intuitive interfaces that make it easy to navigate and make informed choices. Moreover, not all platforms provide sufficient visibility for small or independent sellers, making it difficult to effectively reach potential customers.

The sellers may face difficulty in getting a professional and well-structured online space to market their products, especially individuals and small businesses. They need a system in place that allows them to provide detailed product descriptions, create inventory levels and effectively communicate product availability. If they do not have this platform, they may miss out on business opportunities as a customer may choose to go with a more organized or established competitor. This results in a market opportunity problem, as starting enterprises are excluded from the digital economy because they don't have the technological tools to participate efficiently.

In the face of these difficulties, a special business web application that connects buyers and sellers in one unified online environment is clearly needed. This platform ought to offer a structured, dependable and client-centric shopping experience, offering consumers precise product information and for sellers to handle their inventory more capable. The system would overcome current market constraints, increase reach and help both consumers and small-scale buyers and sellers in the tech industry.

Proposed Solution:

The proposed solution to the identified challenges is the development of Najd Tech Store, an ecommerce platform that would be especially dedicated to the sale and purchase of technological devices. The purpose of this platform is to overcome the shortcomings of current online marketplaces by providing a structured, reliable, and user-centered online environment. Buyers can use the Najd Tech Store to view products by category, view specific details, search for products, add items to their shopping cart and checkout securely. All these attributes make it easier for customers to make informed buying choices and have a seamless and user-friendly shopping experience.

On the other hand, the platform will give a professional and organized section to the sellers where they can showcase their gadgets in a professional way to the public. Sellers will have the ability to post products, photos, price and availability details so that their products will be presented clearly and in an attractive manner. This systematic way helps not only with increased visibility of their products but also aids in their ability to compete in the digital environment. The platform has made the listing and management process easier, allowing sellers to have a platform to promote their products even if they had no idea where to list them online or how to manage them.

The user-friendliness of the proposed web application will be ensured by providing an easy-to-navigate, visually attractive, and clean interface, and by optimizing product displays for user-friendliness. Organized product categories, high-quality images, and well-structured descriptions will contribute to a more engaging and informative shopping environment. This is a more convenient way for customers to compare and assess products and for sellers to market their inventory.

Overall, Najd Tech Store will function as a comprehensive web-based marketplace that enhances convenience, supports business operations, and demonstrates the practical application of web technologies in solving real-world commercial challenges. The platform will connect buyers and sellers, and make the technology product digital marketplace more efficient, easier-to-access, and trustworthy.

Objectives of the Web Application:

Provide a Centralized Digital Marketplace for Tech Products

The main goal of the Najd Tech Store is to create an integrated electronic platform for the effective interaction of people who buy and sell technological devices. The system will simplify the digital selling and buying process by providing a structured and dependable marketplace for tech products.

Enhance the Customer Shopping Experience

The platform aims to provide seamless and intuitive user experience, enabling users to explore categories, view detailed product specifications, compare products, and make secure online transactions. This objective is to enhance the decision-making process and to deliver a hassle-free shopping experience.

Help Small Sellers and Independent Vendors

One of the applications' main aims is to empower people and small businesses by giving them a professional space to list, manage and promote their products. The system is designed to streamline the entire process of posting products, managing inventory, and providing visibility to potential customers, ensuring that sellers can easily access a larger customer base and stay competitive in the digital marketplace.

Make sure that the product presentation is clear, organized and high quality

The website's goal is to showcase products through proper categorization, high quality graphics, and detailed descriptions. This goal will increase transparency, customer trust and the quality of product information on the Internet.

Develop and explain how to apply Web Technologies for solving business problems

The project seeks to demonstrate the ability of the web and modern web technologies to solve real world business issues, such as market access for small businesses and lack of reliable information about products for consumers.

Increase Accessibility and Convenience in the Tech Market

The application's overall goal is to streamline and simplify tech devices transactions for everyone, making them more convenient, accessible and efficient to use with a centralized and easy-to-navigate platform.

System Overview

Explore Store & View Seller Dashboard Buttons

When users press the "Explore Store" button from the Home page, they are taken to the, which contains all products available for purchase on the website. The Catalog page allows customers to navigate through multiple product categories, search for specific items, apply different types of filters, and view detailed product information such as descriptions, pricing, star ratings, and specifications.

View seller dashboard

By pressing the "View seller dashboard" button on the Home page, the user will be redirected to an operational dashboard page specifically designed for sellers and administrators. The operational dashboard allows sellers to view and monitor key aspects of their business operations, such as sales performance, revenue, customer orders, inventory, and operational updates through charts and data panels.

Open Selected Product Button

When the user clicks the "Open selected product" button within the catalog, the browser redirects them to the product details page, where they can view more detailed information about the selected item, including its description, specifications, price, and related products

Chat with Seller Button

Once the user presses the "Chat with seller" button on the Product Details page, the browser sends a request to the seller's WhatsApp communication page based on the seller's contact number. This feature enables buyers to communicate directly with sellers to ask product-related questions, negotiate terms, confirm stock availability, or request further details prior to purchasing.

Checkout Navigation Buttons

When the user presses the "Continue to checkout" or "Proceed to checkout" button from the Cart page, the browser redirects them to the Checkout page, where customers can complete the purchasing process by entering their delivery details, payment information, and reviewing their final order summary before placing the order.

The Checkout page provides a structured and secure purchasing experience by displaying important order details such as product quantity, pricing, delivery information, and final payment totals. This transition from the Cart page to the Checkout page demonstrates how the website guides users through the purchasing workflow in a smooth and organized manner, helping customers complete transactions more efficiently.

Features / Functionalities

1. Main Page

- View the main product categories visually attractively
- Store statistics such as the number of products, sellers and customer satisfaction ratio
- Quick navigation buttons for the catalog and control panel

2. Catalog

- View all products in a regulated card network
- Instant search for any product by name while typing
- Filter by category: phones, laptops, headphones, watches, tablets, camera, games
- Sort by price ascending, descending or by feature
- The message "No results" appears when any product does not match

3. Product Page

- View full product details: name, price, rating, description, and technical specifications
- Load product data dynamically according to the product chosen from the catalog
- Add product button to the cart with instant confirmation
- Save product button for favorites

- Contact the seller via WhatsApp

4. The basket

- Offer added products with name and price
- Control the quantity of each product via + and – buttons
- Automatic total recalculation when any quantity is changed
- Calculation of delivery and discount fees in the final price
- Go button to complete the payment process

5. Payment

- An integrated model for entering customer data, address and payment method
- Validate all mandatory fields before completing the application
- Color the empty fields red as a visual indicator of the error
- A message confirming the success of the request and guiding the control panel

6. Account

- Switch between login and one-click registration mode
- Email and password login form
- Check the fields with an error message when leaving any field empty
- Direct the user to the control panel after successfully logging in

7. Control Panel

- View store statistics: total sales, number of orders, active products
- Bar charts that move when loading the page
- Schedule of recent orders with the status of each order
- Dynamically add a new request to the table without reloading the page
- Sales statistics speak automatically every 5 seconds

4. Technologies Used (Technologies Used)

First: HTML

The project was built using HTML5 while taking care to use the correct semantics that reflect a clear and organized structure. The application consists of seven interrelated pages: the main, the catalog, the product details, the cart, the payment, the account, and the control panel.

Semantic tags such as <header>, <nav>, <main>, <section>, and <footer> were used on each page to ensure a clear and easy-to-understand structure. The aria-label feature was also added to improve accessibility, and data-category and data-product properties to link HTML elements to the JavaScript file.

Second: CSS

A unified style.css format file has been developed that serves all seven application pages, ensuring full visual consistency in the design. The file is based on a unified color scheme that reflects a professional visual identity of the store. Using CSS Flexbox and CSS Grid to build responsive layouts that work on different screen sizes Product card design with hover effects and smooth transitions improve the user experience Uniform fixed navigation bar with visually active page highlighting Design forms, buttons and tables in a modern and consistent style across all pages Relying on uniform colors and fonts that give the store a clear visual identity

Third: JavaScript

A unified script.js file has been developed that controls all interactions and the programming logic of all application pages. The file uses the DOMContentLoaded style to ensure that the entire page loads before executing any code, with functions logically organized according to each page. Instant search function in the catalog by filtering product cards as you type Filter function by category and order by price ascending and descending Download product details dynamically from JavaScript database without having to reload the page Control the quantities of the basket with the total automatically recalculated at each change Validation of the payment form before completing the order with visual indicators of errors System for switching tabs on the account page between login and registration Vendor control panel with live statistics speaking automatically and the possibility of adding new orders

Updated Gantt Chart:

Conclusion:

At the end of this project, an integrated functional web application was developed under the name Najd Tech Store, which represents a prototype of a regional e-commerce platform specializing in the sale of technical devices. The application includes seven interconnected pages covering the entire user's journey from browsing products to completing the purchase process and managing orders.

All the required technical requirements have been achieved using HTML5 to build a clear semantic structure, the CSS to design a professional and consistent visual interface, and JavaScript to apply advanced interactive logic that includes search, filtering, verifying forms and dynamically updating data.

This project contributed to the application of the concepts learned from the BIS 351 course to a realistic business context and demonstrated the ability to build a structured and scalable web application. In the future, the project could be developed by adding a real database, an electronic payment system, and multilingual support to expand the service.
